>>> Explain photosynthesis in 2 sentences
```

Photosynthesis is the process where plants use sunlight, water, and carbon dioxide to create their own food (sugar) and release oxygen as a byproduct. Essentially, it's how plants convert light energy into chemical energy to sustain life.

```
>>> Explain photosynthesis
```

Photosynthesis is a natural process by which green plants, algae, and some bacteria convert light energy, usually from the sun, into chemical energy in the form of glucose (a type of sugar). This process also releases oxygen as a byproduct. Here's a simplified breakdown of photosynthesis:

1. **Light-dependent reactions**: These reactions take place in the thylakoid membranes of the chloroplasts, which are found inside plant cells. The light energy absorbed from the sun is used to convert water (H₂O) and carbon dioxide (CO₂) into ATP (adenosine triphosphate), a high-energy molecule, and NADPH (nicotinamide adenine dinucleotide phosphate), another high-energy molecule. The light-dependent reactions also release oxygen as a byproduct.

2. **Calvin Cycle (Light-independent reactions)**: These reactions take place in the stroma of the chloroplasts. ATP and NADPH produced during the light-dependent reactions are used to convert carbon dioxide into glucose or other organic compounds. Water is also required for this process.

The overall equation for photosynthesis can be represented as follows:

$$6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 \text{ (glucose)} + 6\text{O}_2$$

This equation shows that for every six molecules of carbon dioxide and six molecules of water, the plant produces one molecule of glucose (a simple sugar) and releases six molecules of oxygen. Photosynthesis is crucial for life on Earth as it provides most of the oxygen in our atmosphere and serves as

>>> explain cell in biology in 3 sentences
Here are three sentences explaining cells in biology:

A cell is the basic structural and functional unit of living organisms, consisting of a membrane-bound compartment containing various organelles, cytoplasm, and genetic material (DNA or RNA). Cells perform specific functions such as nutrition, waste removal, metabolism, growth, reproduction, and response to stimuli, and they can be classified into different types based on their morphology, function, or tissue origin. The study of cells is known as cell biology or cytology, which provides insights into the fundamental principles governing life processes in all organisms, from bacteria to humans.

The three models cover different jobs — Gemma 3 handles the heavy thinking (explanations, questions), Mistral is a backup if your PC is slow, and nomic-embed-text is tiny but important for searching through uploaded notes.

  What Each Model Will Do in YOUR PROJECT	
Task	Model
Explain content	gemma3:12b
Summarize notes	gemma3 / llama3
Generate questions	gemma3
Faster fallback	mistral
Text search/memory	nomic-embed-text
